

# Lecture 7 Enhanced Entity Relationship (EER) Model

- EER stands for Enhanced ER or Extended ER
- EER Model Concepts
  - Includes all modeling concepts of basic ER
  - Additional concepts:
    - subclasses/superclasses
    - specialization/generalization
    - categories (UNION types)
    - attribute and relationship inheritance
- The additional EER concepts are used to model applications more completely and more accurately

Ref.: Chapter 4

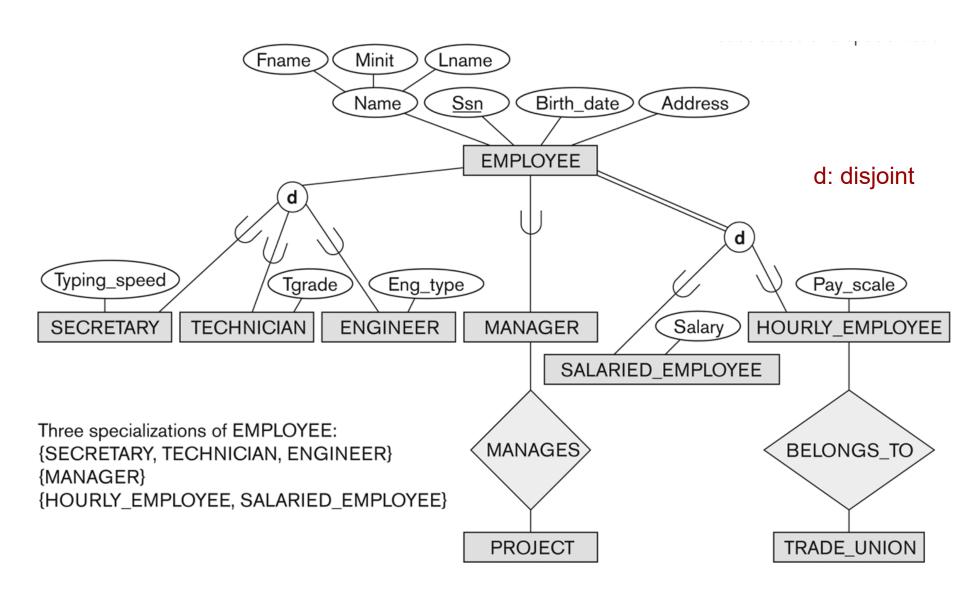

## **Subclasses and Superclasses**

- An entity type may have additional meaningful subgroupings of its entities
  - Example: EMPLOYEE may be further grouped into:
    - SECRETARY, ENGINEER, TECHNICIAN, ...
      - Based on the EMPLOYEE's Job
    - MANAGER
      - EMPLOYEEs who are managers
    - SALARIED\_EMPLOYEE, HOURLY\_EMPLOYEE
      - Based on the EMPLOYEE's method of pay
- EER diagrams extend ER diagrams to represent these additional subgroupings, called *subclasses* or *subtypes*

### **BAIHOC HOASEN** Subclasses and Superclasses

### Subclasses and Superclasses (2)

- Each of these subgroupings is a subset of EMPLOYEE entities
- Each is called a subclass of EMPLOYEE
- EMPLOYEE is the superclass for each of these subclasses
- These are called superclass/subclass relationships:
  - EMPLOYEE/SECRETARY
  - EMPLOYEE/TECHNICIAN
  - EMPLOYEE/MANAGER

•

### **Subclasses and Superclasses (3)**

- These are also called IS-A relationships
  - SECRETARY **IS-A** EMPLOYEE, TECHNICIAN **IS-A** EMPLOYEE, ....
- Note: An entity that is member of a subclass represents the same real-world entity as some member of the superclass:
  - The subclass member is the same entity in a *distinct* specific role
  - An entity cannot exist in the database merely by being a member of a subclass; it must also be a member of the superclass
  - A member of the superclass can be optionally included as a member of any number of its subclasses

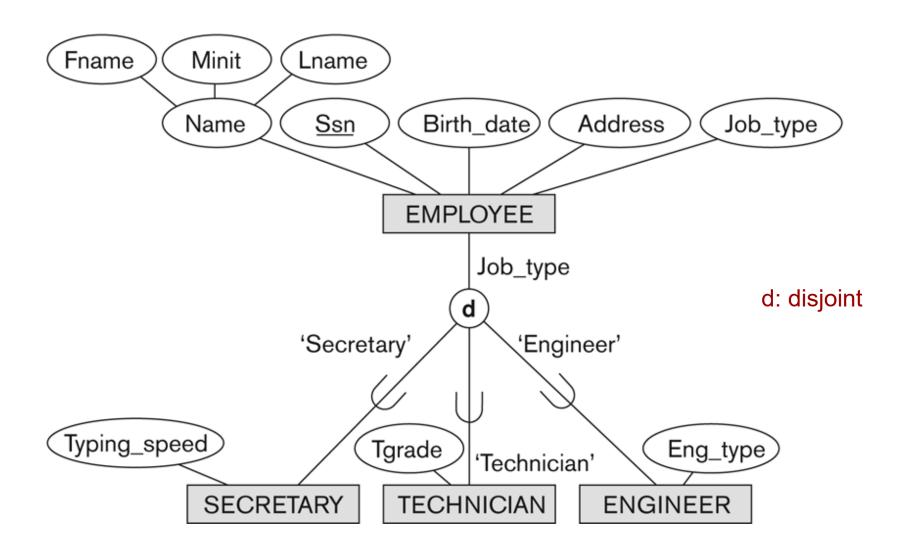

## **Subclasses and Superclasses (4)**

- Examples:
  - A salaried employee who is also an engineer belongs to the two subclasses:
    - ENGINEER, and
    - SALARIED\_EMPLOYEE
  - A salaried employee who is also an engineering manager belongs to the three subclasses:
    - MANAGER,
    - ENGINEER, and
    - SALARIED\_EMPLOYEE
- It is not necessary that every entity in a superclass be a member of some subclass

#### Representing Specialization in EER Diagrams

# Attribute Inheritance in Superclass / Subclass Relationships

- An entity that is member of a subclass inherits
  - All attributes of the entity as a member of the superclass
  - All relationships of the entity as a member of the superclass

#### Example:

- In the previous slide, SECRETARY (as well as TECHNICIAN and ENGINEER) inherit the attributes Name, SSN, ..., from EMPLOYEE
- Every SECRETARY entity will have values for the inherited attributes

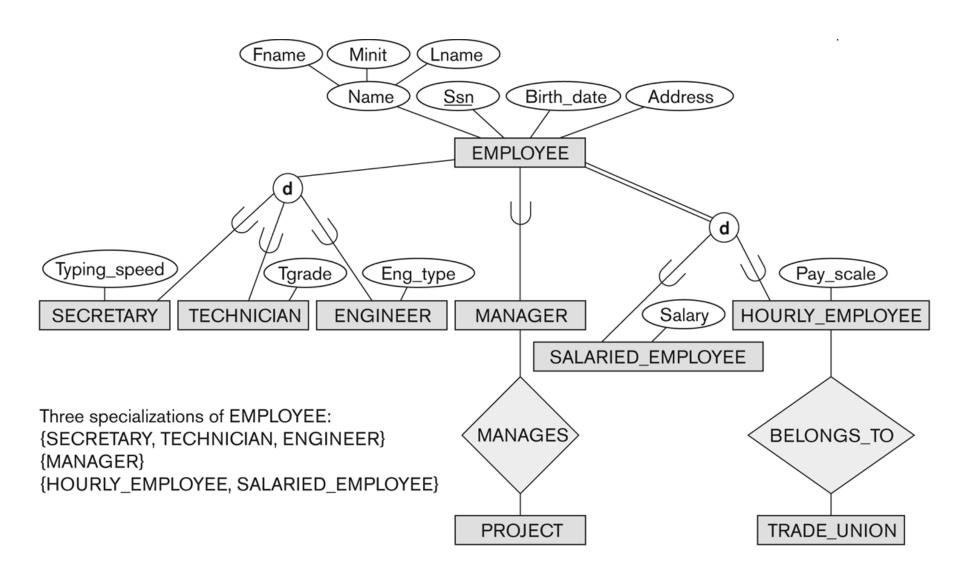

- Specialization is the process of defining a set of subclasses of a superclass
- The set of subclasses is based upon some distinguishing characteristics of the entities in the superclass
  - Example:
    - {SECRETARY, ENGINEER, TECHNICIAN} is a specialization of EMPLOYEE based upon job type.
    - May have several specializations of the same superclass

- Example: Another specialization of EMPLOYEE based on method of pay is {SALARIED\_EMPLOYEE, HOURLY\_EMPLOYEE}.
  - Superclass/subclass relationships and specialization can be diagrammatically represented in EER diagrams
  - Attributes of a subclass are called specific or local attributes.
    - For example, the attribute TypingSpeed of SECRETARY
  - The subclass can also participate in specific relationship types.
    - For example,
      - a relationship BELONGS\_TO of HOURLY\_EMPLOYEE

### **BAIHOC** HOASEN Specialization (3)

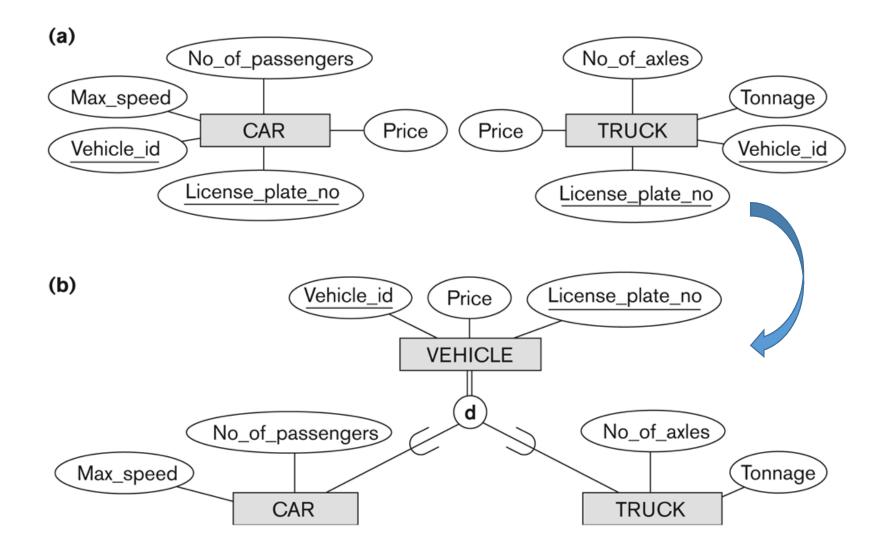

- Generalization is the reverse of the specialization process
- Several classes with common features are generalized into a superclass;
  - original classes become its subclasses
- Example:
  - CAR, TRUCK generalized into VEHICLE;
  - Both CAR, TRUCK become subclasses of the superclass VEHICLE.
  - We can view {CAR, TRUCK} as a specialization of VEHICLE
  - Alternatively, we can view VEHICLE as a generalization of CAR and TRUCK

## **BAI HOC HOA SEN** Generalization (2)

### Generalization and Specialization

- Diagrammatic notation are sometimes used to distinguish between generalization and specialization
  - Arrow pointing to the generalized superclass represents a generalization
  - Arrows pointing to the specialized subclasses represent a specialization
  - We do not use this notation because it is often subjective as to which process is more appropriate for a particular situation
  - We advocate not drawing any arrows

#### Generalization and Specialization (2)

- Data Modeling with Specialization and Generalization
  - A superclass or subclass represents a collection (or set or grouping) of entities
  - It also represents a particular type of entity
  - Shown in rectangles in EER diagrams (as are entity types)
  - We can call all entity types (and their corresponding collections) classes, whether they are entity types, superclasses, or subclasses

# **Constraints on Specialization and Generalization**

- If we can determine exactly those entities that will become members of each subclass by a condition, the subclasses are called predicatedefined (or condition-defined) subclasses
  - Condition is a constraint that determines subclass members
  - Display a predicate-defined subclass by writing the predicate condition next to the line attaching the subclass to its superclass

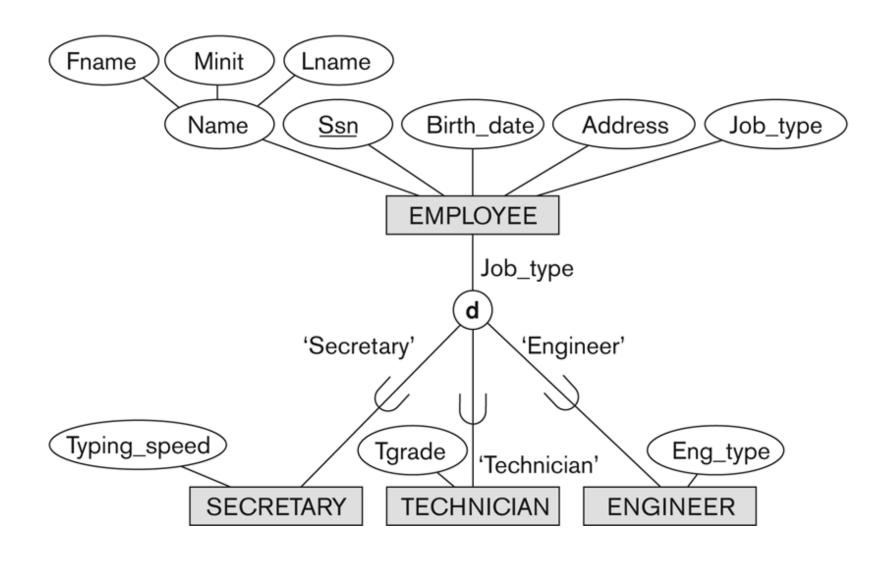

# **Constraints on Specialization and Generalization (2)**

- If all subclasses in a specialization have membership condition on same attribute of the superclass, specialization is called an attribute-defined specialization
  - Attribute is called the defining attribute of the specialization
  - Example: JobType is the defining attribute of the specialization {SECRETARY, TECHNICIAN, ENGINEER} of EMPLOYEE
- If no condition determines membership, the subclass is called user-defined
  - Membership in a subclass is determined by the database users by applying an operation to add an entity to the subclass
  - Membership in the subclass is specified individually for each entity in the superclass by the user

# Displaying an attribute-defined specialization in EER diagrams

# **Constraints on Specialization and Generalization (3)**

- Two basic constraints can apply to a specialization/generalization:
  - Disjointness Constraint
  - Completeness Constraint

# **Constraints on Specialization and Generalization (4)**

- Disjointness Constraint:
  - Specifies that the subclasses of the specialization must be *disjoint*:
    - an entity can be a member of at most one of the subclasses of the specialization
  - Specified by <u>d</u> in EER diagram
  - If not disjoint, specialization is overlapping:
    - that is the same entity may be a member of more than one subclass of the specialization
  - Specified by o in EER diagram

# **Constraints on Specialization and Generalization (5)**

- Completeness Constraint:
  - Total specifies that every entity in the superclass must be a member of some subclass in the specialization/generalization
  - Shown in EER diagrams by a <u>double line</u>
  - Partial allows an entity not to belong to any of the subclasses
  - Shown in EER diagrams by a <u>single line</u>

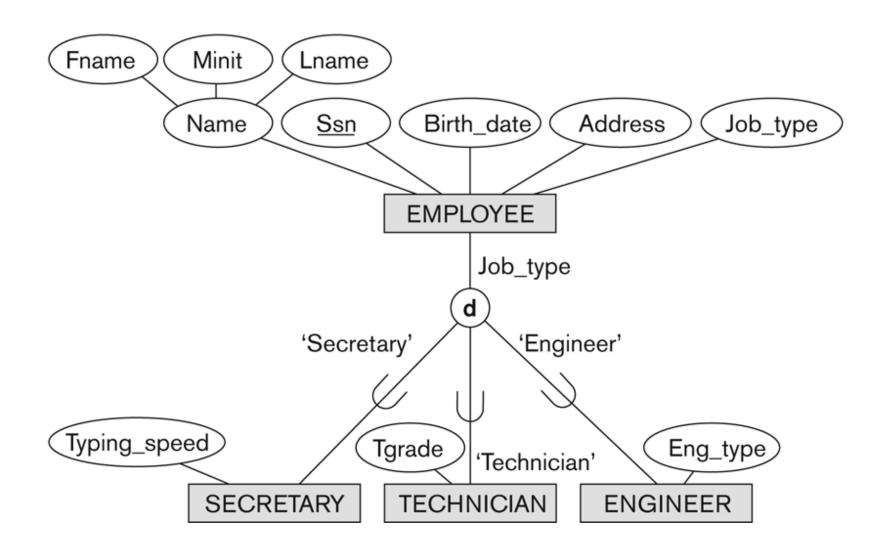

# **Constraints on Specialization and Generalization (6)**

- Hence, we have four types of specialization/generalization:
  - Disjoint, total
  - Disjoint, partial
  - Overlapping, total
  - Overlapping, partial
- Note: Generalization usually is total because the superclass is derived from the subclasses.

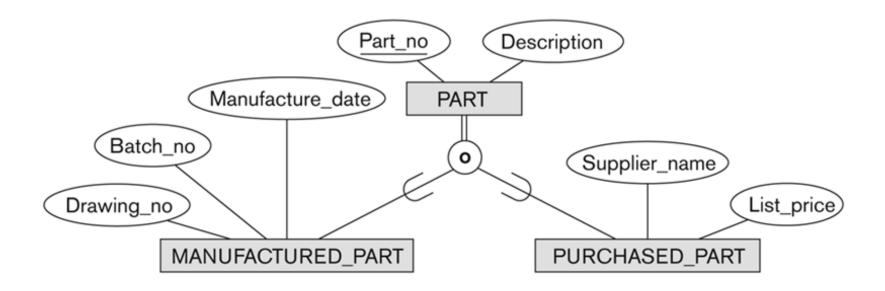

#### **Example of disjoint partial Specialization**

# **Example of overlapping total Specialization**

o: overlapping

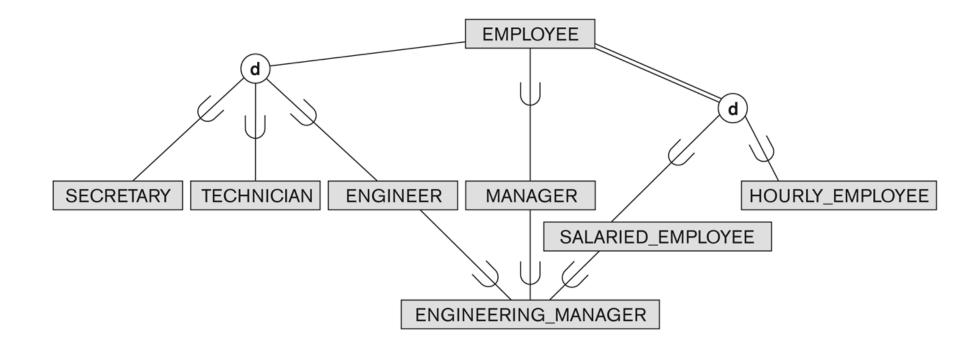

## Specialization/Generalization Hierarchies, Lattices & Shared Subclasses

- A subclass may itself have further subclasses specified on it
  - forms a hierarchy or a lattice
- Hierarchy has a constraint that every subclass has only one superclass (called single inheritance); this is basically a tree structure
- In a lattice, a subclass can be subclass of more than one superclass (called multiple inheritance)

## **DAI HOC HOA SEN** Shared Subclass "Engineering\_Manager"

# Specialization/Generalization Hierarchies, Lattices & Shared Subclasses (2)

- In a lattice or hierarchy, a subclass inherits attributes not only of its direct superclass, but also of all its predecessor superclasses
- A subclass with more than one superclass is called a shared subclass (multiple inheritance)
- Can have:
  - specialization hierarchies or lattices, or
  - generalization hierarchies or lattices,
  - depending on how they were derived
- We just use specialization (to stand for the end result of either specialization or generalization)

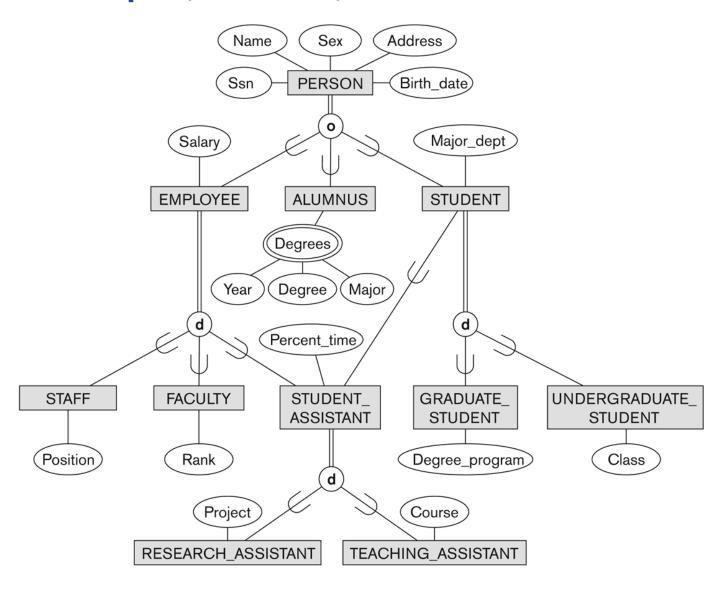

# Specialization/Generalization Hierarchies, Lattices & Shared Subclasses (3)

- In *specialization*, start with an entity type and then define subclasses of the entity type by successive specialization
  - called a top down conceptual refinement process
- In *generalization*, start with many entity types and generalize those that have common properties
  - Called a bottom up conceptual synthesis process
- In practice, a combination of both processes is usually employed

# Specialization / Generalization Lattice Example (UNIVERSITY)

## **Categories (UNION TYPES)**

- All of the superclass/subclass relationships we have seen thus far have a single superclass
- A shared subclass is a subclass in:
  - more than one distinct superclass/subclass relationships
  - each relationships has a single superclass
  - shared subclass leads to multiple inheritance
- In some cases, we need to model a single superclass/subclass relationship with more than one superclass
- Superclasses can represent different entity types
- Such a subclass is called a category or UNION TYPE

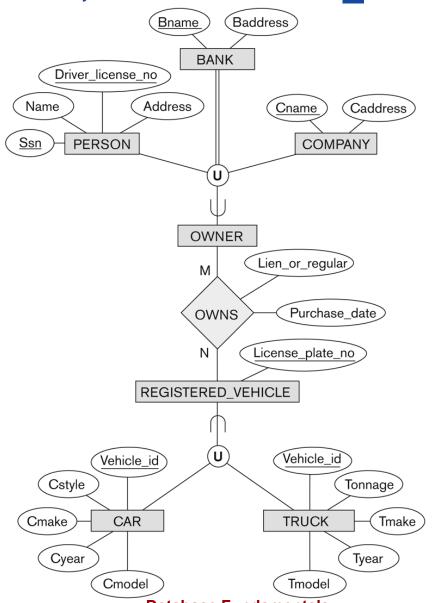

## DAI HOC HOA SEN Categories (UNION TYPES) (2)

- Example: In a database for vehicle registration, a vehicle owner can be a PERSON, a BANK (holding a lien on a vehicle) or a COMPANY.
  - A category (UNION type) called OWNER is created to represent a subset of the union of the three superclasses COMPANY, BANK, and PERSON
  - A category member must exist in at least one of its superclasses
- Difference from shared subclass, which is a:
  - subset of the intersection of its superclasses
  - shared subclass member must exist in all of its superclasses

# Two categories (UNION types): HOASEN OWNER, REGISTERED\_VEHICLE

#### **Formal Definitions of EER Model**

- Class C:
  - A type of entity with a corresponding set of entities:
    - · could be entity type, subclass, superclass, or category
- Note: The definition of relationship type in ER/EER should have 'entity type' replaced with 'class' to allow relationships among classes in general
- Subclass S is a class whose:
  - Type inherits all the attributes and relationship of a class C
  - Set of entities must always be a subset of the set of entities of the other class C
    - S ⊆ C
  - C is called the superclass of S
  - A superclass/subclass relationship exists between S and C

### Formal Definitions of EER Model (2)

- Specialization  $Z: Z = \{S_1, S_2, ..., S_n\}$  is a set of subclasses with same superclass G; hence,  $G/S_i$  is a superclass relationship for i = 1, ..., n.
  - G is called a generalization of the subclasses {S<sub>1</sub>,
     S<sub>2</sub>,..., S<sub>n</sub>}
  - Z is total if we always have:
    - $S_1 \cup S_2 \cup ... \cup S_n = G;$
    - Otherwise, Z is partial.
  - Z is disjoint if we always have:
    - S<sub>i</sub> ∩ S<sub>j</sub> empty-set for i ≠ j;
  - Otherwise, Z is overlapping.

### Formal Definitions of EER Model (3)

- Subclass S of C is predicate defined if predicate (condition) p on attributes of C is used to specify membership in S;
  - that is, S = C[p], where C[p] is the set of entities in C that satisfy condition p
- A subclass not defined by a predicate is called userdefined
- Attribute-defined specialization: if a predicate A = c<sub>i</sub>
   (where A is an attribute of G and c<sub>i</sub> is a constant value from the domain of A) is used to specify membership in each subclass S<sub>i</sub> in Z
  - Note: If  $c_i \neq c_j$  for  $i \neq j$ , and A is single-valued, then the attribute-defined specialization will be disjoint.

## Formal Definitions of EER Model (4)

- Category or UNION type T
  - A class that is a subset of the union of n defining superclasses

```
D_1, D_2,...D_n, n>1:
• T \subseteq (D<sub>1</sub> \cup D<sub>2</sub> \cup ... \cup D<sub>n</sub>)
```

- Can have a predicate pi on the attributes of D<sub>i</sub> to specify entities of D<sub>i</sub> that are members of T.
- If a predicate is specified on every  $D_i$ :  $T = (D_1[p_1] \cup D_2[p_2] \cup ... \cup D_n[p_n])$

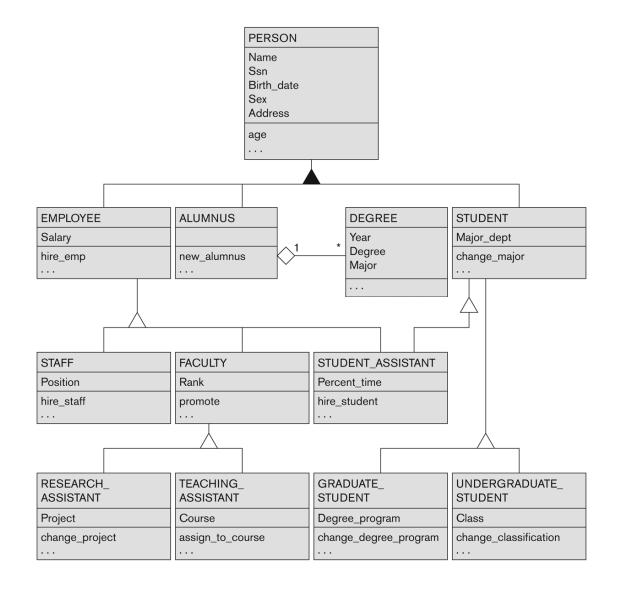

#### **Alternative diagrammatic notations**

- ER/EER diagrams are a specific notation for displaying the concepts of the model diagrammatically
- DB design tools use many alternative notations for the same or similar concepts
- One popular alternative notation uses UML class diagrams
  - see next slides for UML class diagrams and other alternative notations

# **UML Example for Displaying Specialization /**HOA SEN Generalization

## **PAI HOC HOA SEN** Alternative Diagrammatic Notations
